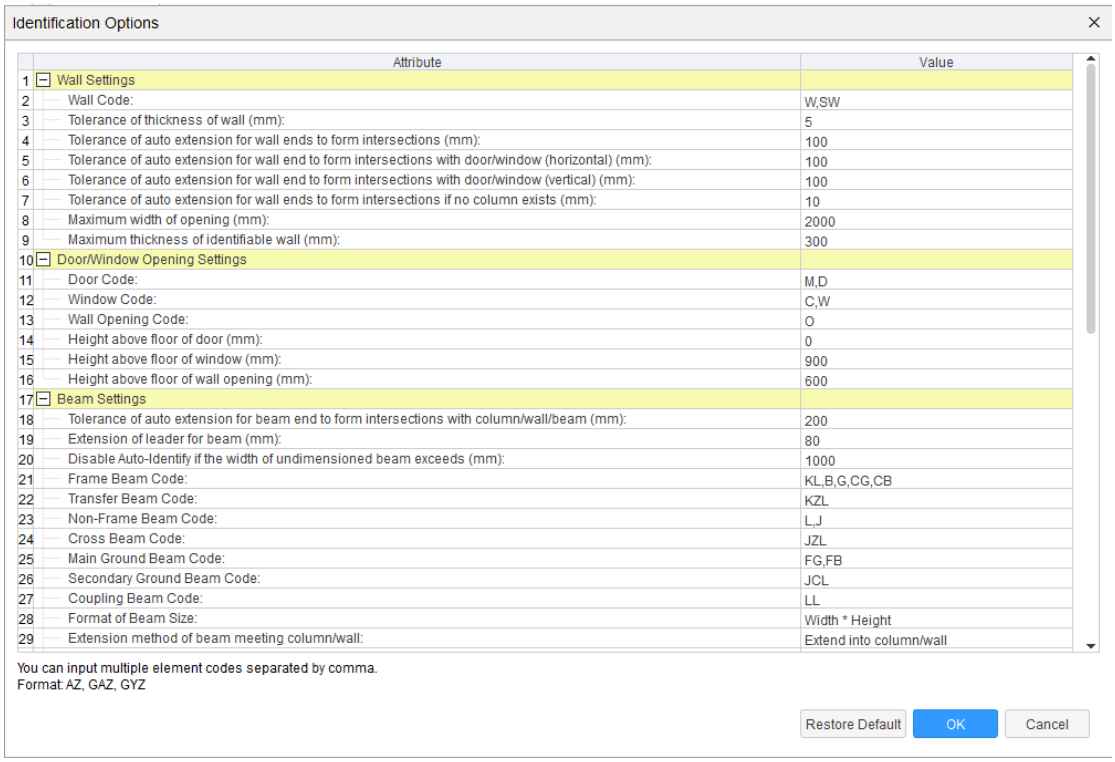
Identification Options

You can use this function to set basic attributes of element entities in CAD drawings that you want to identify.

Click **Identification Options**, and the following window appears.



Note

1. You can modify it as needed.

2. Element code refers to the labels that can be identified as the corresponding element.

3. Line Merge Settings: In PDF files, if the distance between line segments of broken lines falls in the set value, the line segments can be merged automatically and identified normally.

4. Correction of Sideline Length Errors: Contains Auto Mode and Manual Mode.
