# Extend Edge

When calculating volumes and formwork areas of slabs, it is required to

calculate to the edges of walls and beams. You can use this function to extend

slabs to the edges of walls and beams when drawing entities, to make sure

that the quantities are calculated correctly.

1. Click Extend Edge, and then select the slab entities that you want to extend.

2. Right-click to confirm

Note

1.Extend Edge is available for both in-situ and precast slabs.

2.The beam type includes beam and coupling beam.

3.When slabs are intersecting with both walls and beams, and the widths of

beams and walls are different, the slabs will extend by the largest width.
